

Task 1: Basic Network Scanning with Nmap

Objective

Perform a basic network scan using Nmap to identify active hosts and open ports.

Tools Used

- Nmap 7.99
- Windows 11
- Command Prompt

Procedure

- Step 1: Verify Nmap Installation

Command: `nmap --version`

Explanation: Verifies that Nmap is installed correctly.

Expected Output: Displays the installed version.

- Step 2: Identify the Local Network

Command: `ipconfig`

Explanation: Displays the IPv4 address to determine the subnet.

Expected Output: Shows IPv4 address and subnet.

- Step 3: Scan the Network

Command: `nmap 192.168.36.0/24`

Explanation: Scans the subnet to identify hosts and open ports.

Expected Output: Displays scan results.

- Step 4: Save Results

Command: `nmap 192.168.36.0/24 -oN scan_results.txt`

Explanation: Saves the output to a text file.

Expected Output: `scan_results.txt` created.

Results

Detected one active host and open ports 135, 139, 445 and 3306.

Conclusion

Successfully completed Task 1 and documented the scan results.
